

# CS 261: Data Structures

## Sorted Linked Lists

# Complexity – Lists and Arrays

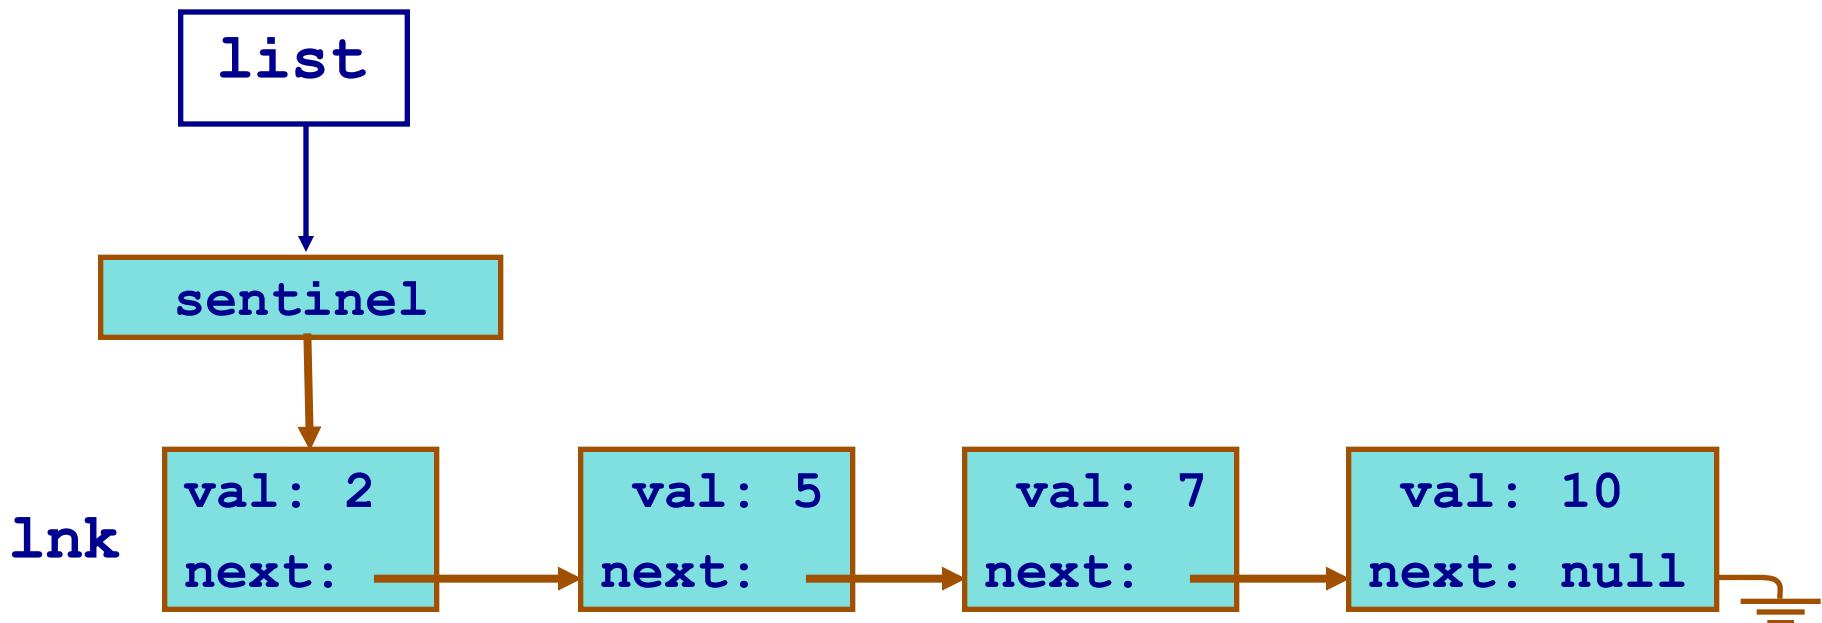

- Unordered linked have:
  - Fast Add operation:  $O(1)$
  - Slow Search (Contains):  $O(n)$
- Sorted Arrays have:
  - Slow Add operation:  $O(n)$
  - Fast Search  $O(\log n)$

# Complexity – Lists and Arrays

- Unordered linked have:
  - Fast Add operation:  $O(1)$
  - Slow Search (Contains):  $O(n)$
- Sorted Arrays have:
  - Slow Add operation:  $O(n)$
  - Fast Search  $O(\log n)$

**What about  
sorted lists?**

# Sorted Linked List

# Operations for Sorted Linked Lists

- Add:
  - find the correct location,
  - add the new element
- Contains:
  - find the correct location,
  - check if the element is in the list
- Remove:
  - find the correct location,
  - remove the element if found in the list

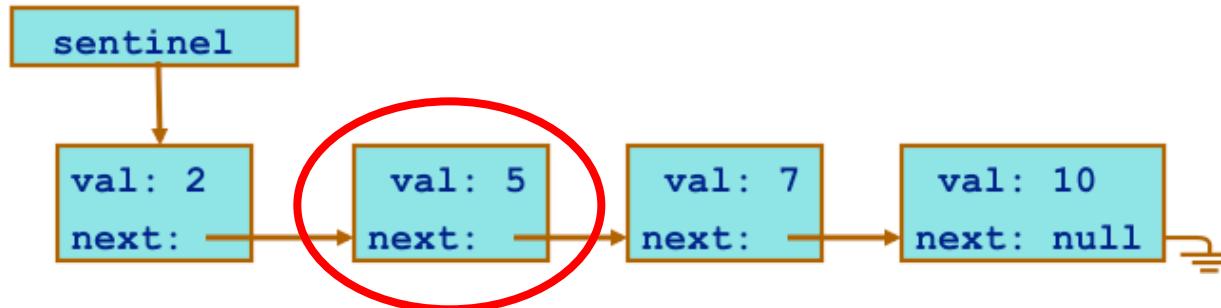

# Sorted List Structure Definition

```
struct list {  
    struct link * Sentinel;  
  
    int size;  
};
```

# Find an Element in a Sorted List

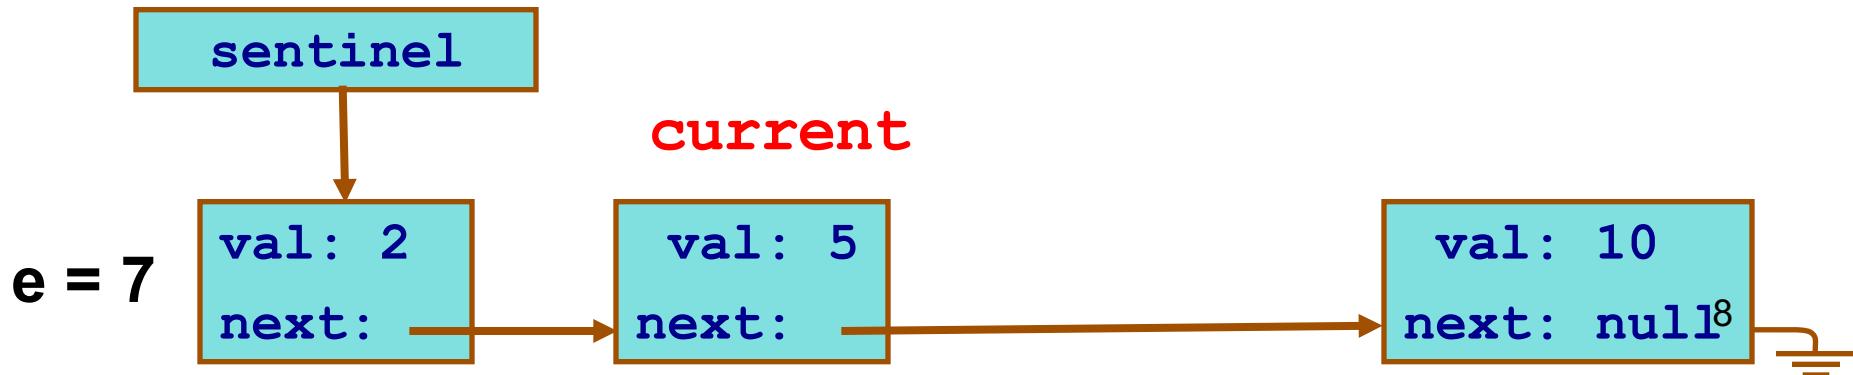

```
struct link * slideRightSortedList  
    (struct link *current, TYPE e) {  
  
    assert(current);  
  
    while ((current->next != 0)  
        && LESS_THAN(current->next->value, e))  
  
        current = current->next;  
  
    return current; /* Returns the link RIGHT BEFORE */  
}
```

e = 7

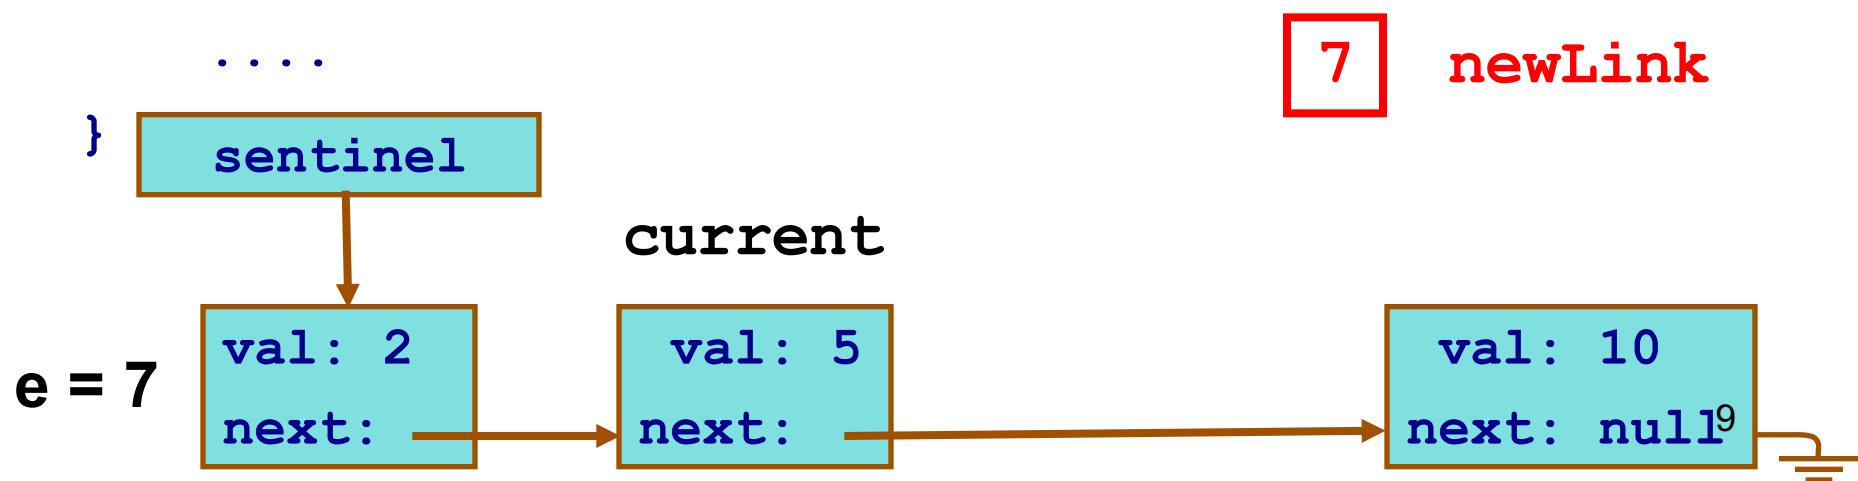

# Add Sorted List

```
void addSortedList (struct list* lst, TYPE e) {  
    assert(lst);  
    struct link * current =  
        slideRightSortedList(lst->Sentinel, e);  
    ...  
}
```

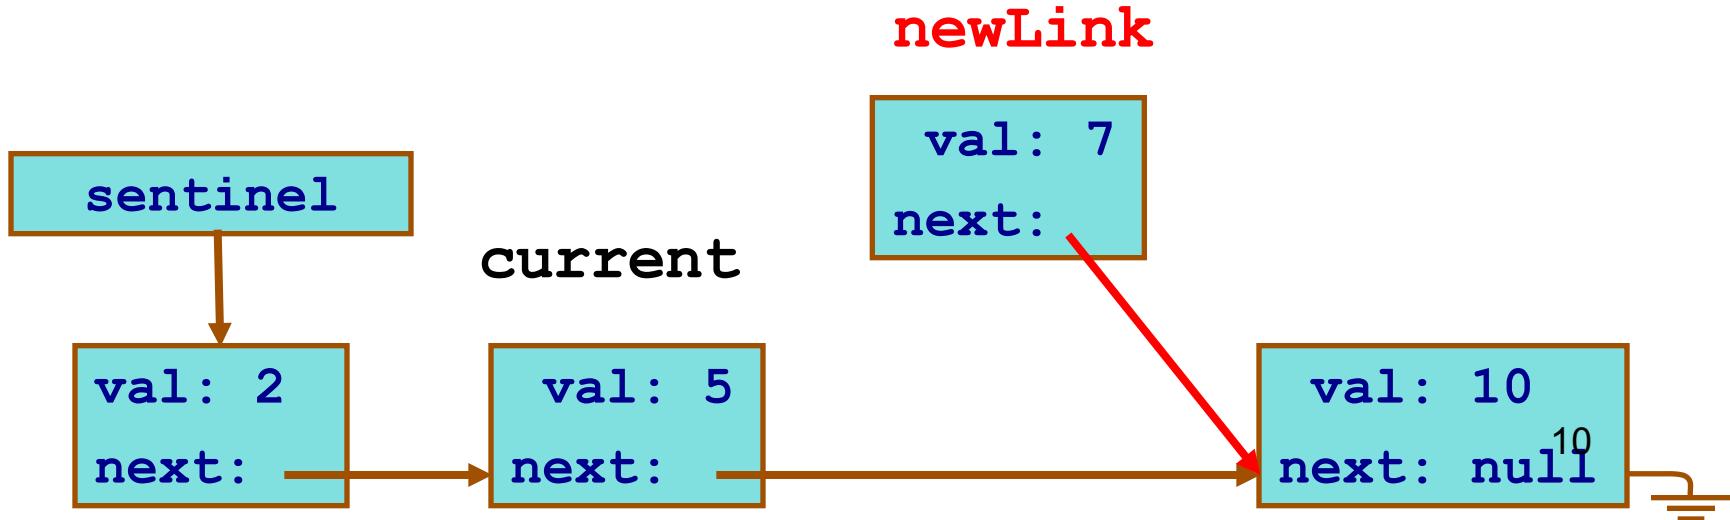

# Add Sorted List

```
void addSortedList (struct list* lst, TYPE e) {  
    assert(lst);  
    struct link * current =  
        slideRightSortedList(lst->Sentinel, e);  
    struct link * newLink =  
        (struct link *) malloc(sizeof(struct link));  
    assert (newLink != 0);  
    newLink->value = e;  
    ....  
}
```

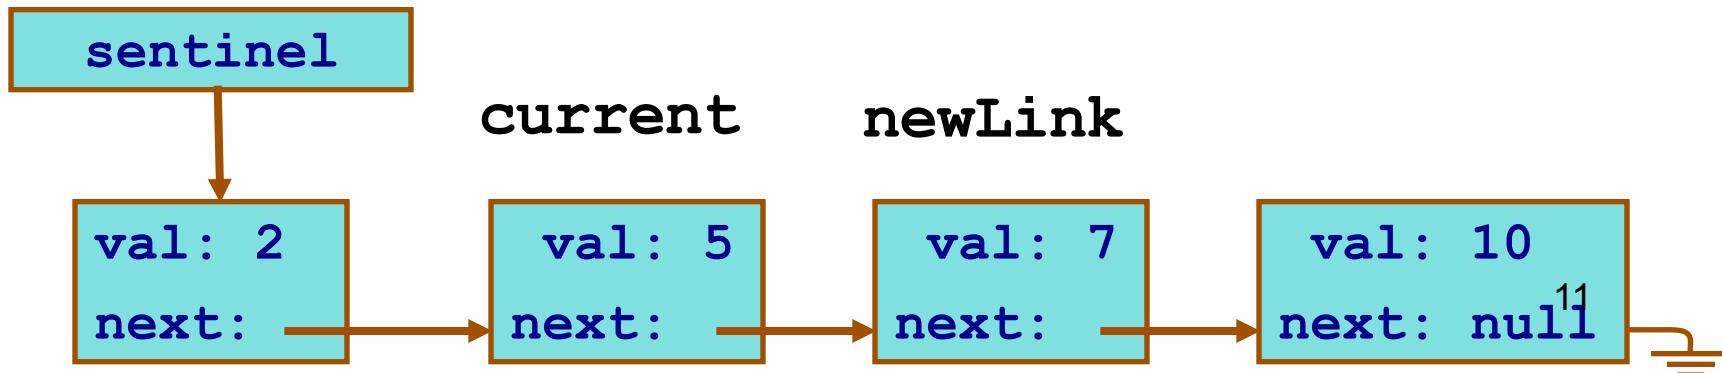

# Add Sorted List

```
void addSortedList (struct list* lst, TYPE e) {  
    ...  
  
    newLink->next = current->next;  
  
    /* For doubly linked lists */  
  
    /* newLink->previous = current; */  
  
    ...  
  
}
```

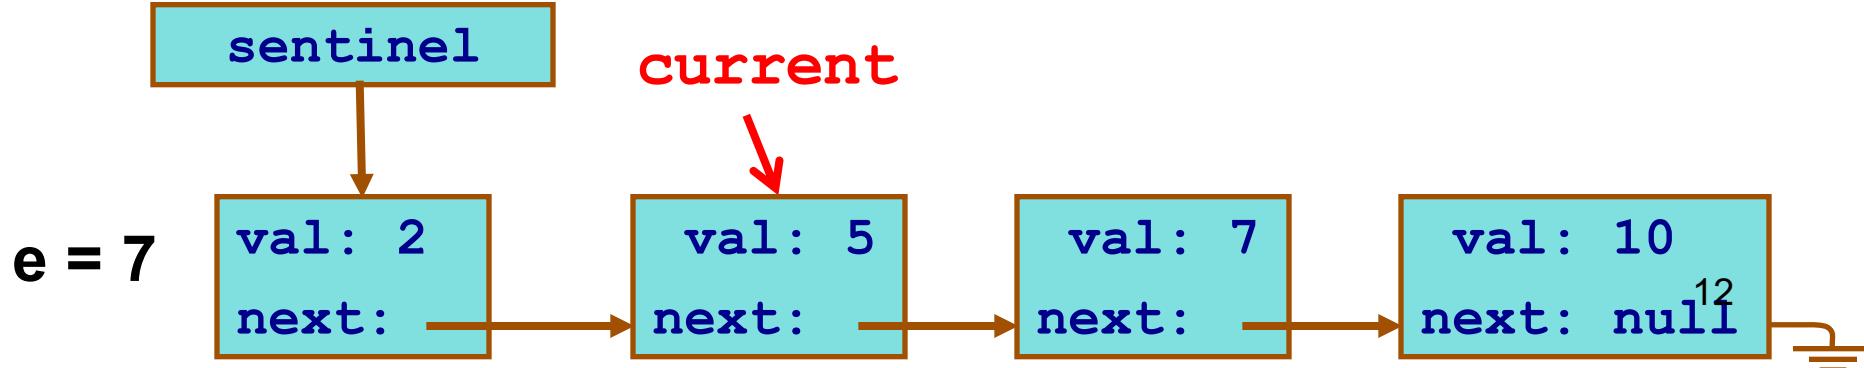

# Add Sorted List

```
void addSortedList (struct list* lst, TYPE e) {  
    ...  
  
    newLink->next = current->next;  
  
    /* For doubly linked lists */  
  
    /* newLink->previous = current; */  
  
    /* current->next->previous = newLink; */  
  
    current->next = newLink;  
  
    lst->size++;  
  
}
```

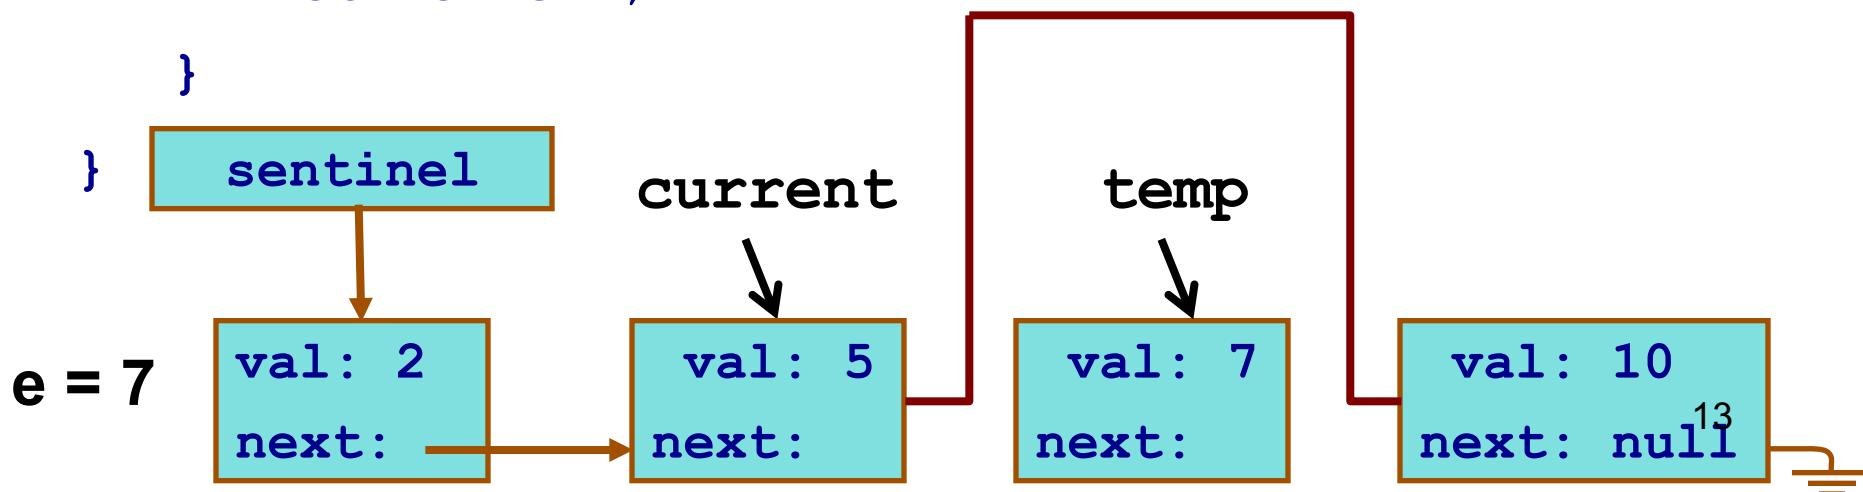

# Remove Sorted List

```
void removeSortedList (struct list *lst, TYPE e) {  
    struct link * temp; assert(lst);  
    struct link * current =  
        slideRightSortedList(lst->Sentinel, e);  
    if ((current->next != 0) &&  
        (EQ(current->next->value, e))) {  
        ....  
    }  
}
```

# Remove Sorted List

```
void removeSortedList (struct list *lst, TYPE e) {  
    ... if ( ... ) {  
        temp = current->next  
        current->next = current->next->next;  
        /* For doubly linked lists */  
        /* current->next->previous = current; */  
        free(temp);  
        lst->size--;  
    }  
}
```

# Sorted Linked List

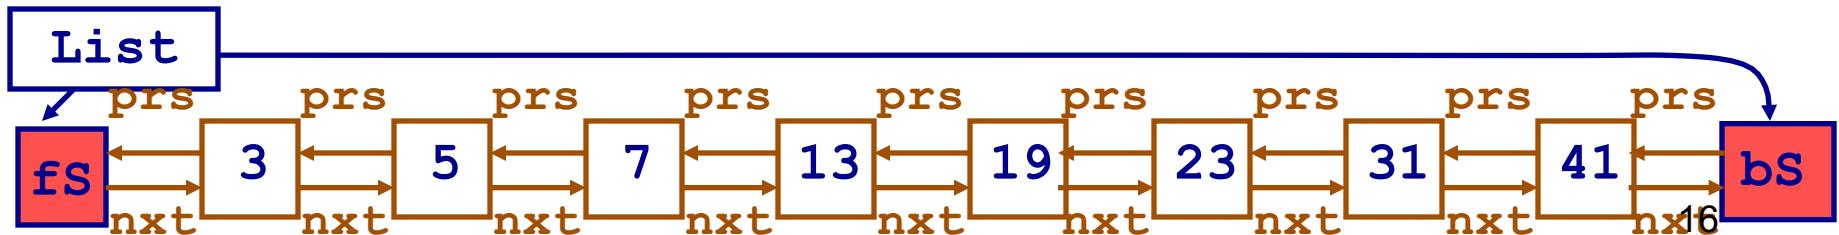

- What is complexity of:
  - search  $O( ?? )$
  - insertion  $O( ?? )$
  - removal  $O( ?? )$
- Because we do not have a direct access to each link in the list

# Problem with Sorted List

- What's the use?
- Add, contains, remove →  $O(n)$
- No better than an unsorted list
- **Major problem: sequential access**

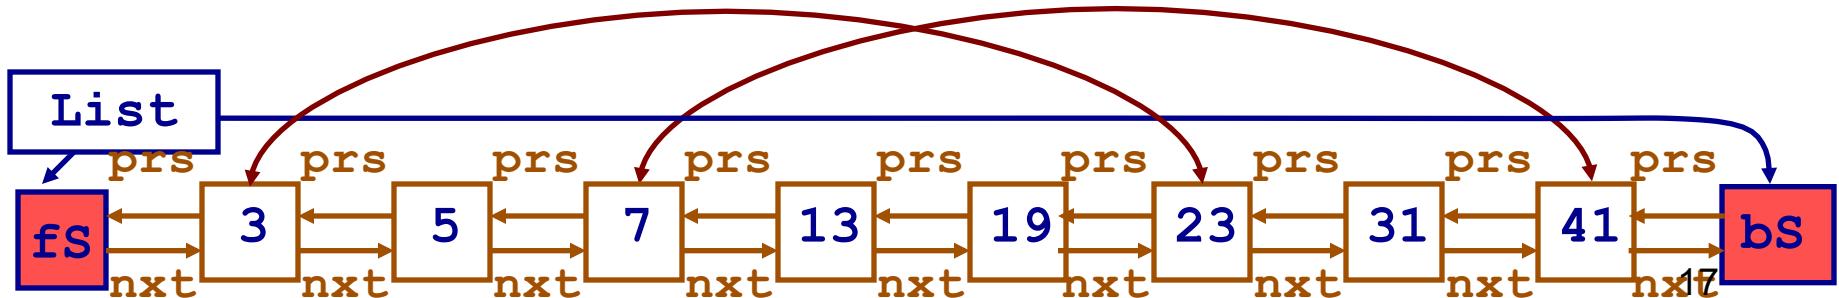

# Sorted Linked List

- How to make a sorted linked list have faster operations?

# Sorted Linked List

- Should I add more pointers?
  - E.g., add  $\log n$  pointers

# Adding more pointers...

- In theory this would work
- Would give us  $O(\log n)$  search
- Hard to maintain insertion and removal
